I’m excited to share my recently completed project on a sales analysis dashboard using Power BI. Extracting the raw dataset, transform to get a clean data and loading to my reporting canvas. Calculating and presenting a data visualization of large datasets covering a 1-year period (January-December). The dataset included information on the type of transaction, product name, shipping mode, customer details and regions. I was able to create the dashboard that enables the business to track their Key performance indicators (KPIs) such as Total sales, profit made, profit margin by %, number or goods ordered monthly and identifying the high value customers using Power Business Intelligence.

📊 **Sales Dashboard Highlights ;**

1. Total sales of 470.53k within a year, which leads to a profit of 61.62k and a profit margin % of 13.10%

2. Dashboard visualization shows Furniture was the top-selling product with total sales of 0.17M (170.52k), followed by technology with total sales of 0.16M(162.78k), Office supplies has the least number of products sold with total 0.14M(137.23k) within a year

3. We’re able to know the top 10 products sold with customers location regions.

4. Demography Performance shows the Total number of customers, Order quantity sold, Total Unique orders and Average sales per customer

5. Demography Visualization Dashboard also indicate preferred ship mode, top 5 active customers, Top 10 Profitable Customers and Profits by Customer Segment.

6. It also indicates the top 5 states by profit, where we get the total sales and filter it by total profit.

📊 Leveraging the powerful features of Power Business Intelligence, the analysis helps in decisions-making, to know which goods is of high demand, also know where the business needs to step up their game to make more profits and business growth.
